

A B S T R A C T

In a vehicle, each of the pivot assemblies comprises a base secured to the bodywork of the vehicle, a body
5 which is connected to a rear trunk lid via a hinge-forming member, and locking means for locking the body in a position where it is locked relative to said base. The locking means comprise hook-forming means pivotally
10 mounted on the base and adapted to engage a complementary bearing shape of a first engaging element to bear against said bearing shape and to guide the end of the pivoting movement of the lid into the corresponding locked position.
